HIGHLIGHTS OF THE 1985 VITAL STATISTICS IN MARYLAND

POPULATION

The rate of growth of population in the State of Maryland increased in the 1984-1985 period, exceeding the average growth rate experienced in the earlier years of the decade. Between the April 1, 1980 census and the July 1, 1984 estimate, the average annual percentage increase in population for the total State was 0.7 percent; the increase between 1984 and 1985 estimates was 1.0 percent. The net gain in population over the year in the State was 43,050, which brought the estimated State total to 4,392,450 individuals on July 1, 1985.

Within the State, rates of growth varied widely. As in the 1983-1984 period, the Southern Area of the State exhibited the greatest percentage growth during the year. This region experienced an estimated one-year growth rate of 3.3 percent or 6,150 residents. The National Capital Area gained the greatest number of residents during the year, however, adding 18,280 individuals. The slowest rate of growth was exhibited in the Baltimore Metropolitan Area, which increased by 0.5 percent over its 1984 figure with an estimated gain of 12,120 in population.

The subdivisions of the State also exhibited varying rates of growth. Counties estimated to have grown at the highest rates between 1984 and 1985 were Calvert County (4.8%), Howard County (4.6%), Worcester County (3.8%), and Charles County (3.3%). By far, the greatest gain in number of residents occurred in Montgomery County, with an estimated increase of 16,380 over the 1984 figure. Substantial numbers of residents were also added during the year in Howard County (6,330) and Anne Arundel County (5,670). Baltimore City again lost population, although the rate of decline continued to abate, with a loss of 0.5 percent in 1984-1985, compared to 0.7 percent loss in the 1983-1984 period. Three counties were estimated to have lost population in the 1984-1985 period -- Allegany County's population declined by 1,310 (1.7% loss), Baltimore County lost 1,090 residents (0.2% loss) and Garrett County's 1985 estimate was 10 less than the 1984 figure.

Baltimore City remained the most populous subdivision in the State in 1985 with an estimated population of 755,470 on July I, 1985. Prince George's, Baltimore, and Montgomery Counties were the next largest subdivisions in descending order of population. Together these four subdivisions comprised an estimated 62 percent of the State's population. The Baltimore Metropolitan and National Capital Areas, composed of eight of the State's 24 subdivisions, together accounted for slightly more than 80 percent of the State's population in 1985.

Estimates are developed for age groups ranging from individuals under the age of one through persons aged 85 and over. The greatest positive rates of change in the 1984 to 1985 period occurred in the age groups 35-44 (3.5%), Under 1 (3.2%) and those aged one through four and 85 and over (2.9% each). These increases reflect the aging of the baby boom population, the higher number of births in recent years and an increase in life expectancy. Each of the age groups aged 5 through 24 evidenced a decrease between 1984 and 1985, as a result of the decreasing birth rates experienced during the decades of the 1960's and the 1970's.

In terms of distribution by race, the white population gained 0.6 percent between 1984 and 1985, while the "all other races" group increased by 2.0 percent. Members of races other than white accounted for 25.5 percent of Maryland's population in 1985. This percentage represents an increase over the comparable figure for 1984 and continues the trend in recent years of gradual increase in proportion of population in the "all other races" category.

BIRTHS

There were 67,985 resident live births occurring during 1985. This represented a 4.2 percent increase in births over the 1984 total of 65,264. This was the highest number of births for the State since 1970. For the United States, births increased 2 percent between 1984 and 1985.

The crude birth rate rose 3 percent from 15.0 to 15.5 births per 1,000 population. The United States birth rate, 15.8, was 2 percent above the Maryland rate. Rates for white births rose 3.7 percent from 13.4 to 13.9 per 1,000 population; while the rate for all other races rose from 19.7 to 20.1 (2.0 percent increase).

Birth rates increased in all but one political subdivision -- Garrett County. The highest rate, 18.7, again occurred for St. Mary's County residents, while the lowest rate occurred in Allegany County (11.7). In the Baltimore Metro Area, Baltimore City's rate of 17.3 was the highest, while Baltimore County's rate of 13.1 was the lowest.

The general fertility rate, the total number of births per 1,000 women aged 15-44, increased 2.6 percent from 60.5 to 62.1 between 1984 and 1985. Fertility rates for white women increased 2.9 percent from 55.6 to 57.2; while the rate for women of all other races increased from 73.6 to 74.8 (1.6 percent). Nationally, fertility rates for white women (63.0) and women of all other races (83.2) were higher than Maryland's rates.

Birth rates increased for women of all age groups except those aged 15-19 and 45-49. Birth rates for white women were lower than those for women of all other races for all age groups except those aged 30-34. The largest differences in rates between the racial groupings occurred for women under 15 and women aged 15-19.

Women aged 15-19 residing in Baltimore City experienced the highest birth rate for that age group among all political subdivisions (86.6). Montgomery County women exhibited the lowest rate (17.2) for this teenage group. Montgomery and Howard County women showed the two highest birth rates, respectively, among older women aged 30-34 and 35-39.

Birth Rates* by Age of Mother and Fertility Rates**, State of Maryland 1960, 1970, 1980, 1984, 1985

Age of Mother	<u>1960</u>	<u>1970</u>	<u> 1980</u>	1984	1985

^{*}Rates are Live Births per 1,000 Women Aged 15 - 44.

The rise in the fertility rates between 1984 and 1985 was also evidenced in the increases in birth rates for all live-birth orders. Live-birth order refers to the number of children born alive to a mother. Percent increases of almost five percent occurred for the 2nd, 3rd, and "4 & Over" categories. Birth rates for women having a second or third child were higher than for any year since 1972.

Among women having their first child, increases in rates occurred for women in all age groups except the 15-19 year olds and the 40-44 year age groups. Again, the largest gains occurred among women of increasing age. Since 1970, the rates for women 15-19 and 20-24 having a first birth have declined 40 and 27 percent, respectively, while the rates for women 25-29, 30-34, and 35-39 have increased 37.3, 202.8, and 152.4 percent, respectively.

^{**}Rates for 1971 and 1972 Computed Using 1970 Census Population.

^{*}Rates are Live Births per 1,000 Women in Each Age Group.

Births to Unmarried Women

An estimated 19,761 unmarried women give birth in 1985. This number represented an increase of 4.3 percent over the 1984 figure of 18,944. For white unmarried women there was a 6.4 percent increase in births; while for women of all other races, the number rose 3.3 percent. Almost 14 percent of nonmarital births occurred to women 17 years and younger. In Maryland in 1985, 14.8 percent of white births, and 57.8 percent of births of all other races occurred to unmarried women. Nationally, 14.5 percent of white births, 51.4 percent of births of all other races including blacks, and 60.1 percent of black births were nonmarital births.

Hospitalization and Attendant at Birth

More than 99 percent of all births occurred in hospitals -- 96 percent of hospital births occurred in civilian hospitals. The number of nonhospital births declined from 641 in 1984 to 601 in 1985. Overall, 97.6 percent of all births were delivered by a physician. The proportion of births delivered by physicians in civilian hospitals was higher (98.3%) than the same proportion delivered in military hospitals (95.4%). More than 30 percent of births not occurring in hospitals were delivered by physicians.

Low Birth Weight

In 1985, 7.6 percent of all live births were classified as being of low birth weight, weighing less than 2500 grams. By race, 5.4 percent of white births, and 12 percent of births of all other races were born weighing less than 2500 grams. These figures represented increases of 2.7 percent for all races, and 4.3 percent for infants of all other races. Nationally 5.6 percent of white infants, 11.1 percent of infants of all other races including blacks, and 12.4 percent of black infants were of low birth weight.

Length of Gestation

Length of gestation refers to the interval between the last normal menstrual period and the date of birth. Delivery prior to 37 weeks gestation is classified as preterm. In 1985, 8 percent of white births and 17 percent of births of all other races occurred prior to 37 weeks gestation. Births occurring at 42 weeks and over are classified as postterm deliveries. In 1985, 14.5 percent of all births, 15.2 percent of white births, and 13.1 percent of births of all other races were classified as postterm deliveries.

Prenatal Care

More than 79 percent of mothers reporting month of onset of prenatal care made their first prenatal visit in the first trimester of pregnancy. This proportion was unchanged from the 1984 percentage. However, the proportion of mothers seeking prenatal care late (third trimester or not at all) rose from 3.8 to 4.0 percent between 1984 and 1985. This percentage increased from 2.4 to 2.6 for white mothers and from 6.8 to 7.1 for mothers of other races. In 1985, 85.9 percent of white mothers and 67.8 percent of mothers of all other races initiated care during their first trimester of pregnancy.

DEATHS

During 1985, there were 36,607 resident deaths, an increase of 3.5 percent over the 1984 total of 35,331. The crude death rate rose to 8.3 per 1,000 population, a 2.5% increase over the 1984 rate of 8.1. The age-adjusted rate rose from 5.7 per 1,000 population to 5.8 reflecting an increase of almost two percent.

Deaths by Cause

In 1979, the ninth revision of the International Classification of Diseases was first used for coding the underlying cause-of-death. The eighth revision had been in use between 1969 and 1978. Because of coding changes in certain categories of causes of death, comparisons between the 1984 data and data earlier than 1979 should only be made with reference to coding changes. The National Center for Health Statistics has published comparability ratios for mortality data*.

*"Estimates of Selected Comparability Ratios Based on Dual Coding of 1976 Death Certificates by the Eighth and Ninth Revisions of the International Classification of Diseases," Monthly Vital Statistics Report, DHEW Publication No. (PHS) 80-1120, Vol. 28, No. 11, February 1980.

The leading causes of death in 1985 are listed below:

Leading Causes of Death, Maryland 1985

		Crude Death Rate	
		per 100,000	Percent of
Rank	Cause	<u>Population</u>	<u>Total Deaths</u>
1	Diseases of Heart	298.6	35.8
2	Malignant Neoplasms	199.5	23.9

12	Homicide	8.6	9.0	+4.7

^{*}Rates Adjusted to the U.S. 1940 Population by the Direct Method.

**Per 100,000 Population.

^{***}Age-Adjusted Rate Not Calculated for the Tenth Ranked Cause-of-Death Certain Conditions Originating in the Perinatal Period.

There was no change in the rankings of the first seven leading causes of death between 1984 and 1985. Suicide, the ninth leading cause of death in 1984 moved to eighth place. Chronic liver disease and cirrhosis moved from eighth to eleventh place. Nephritis, nephrotic syndrome, and nephrosis fell from tenth to ninth place, and certain conditions originating in the perinatal period increased to tenth place indicative of the increase in infant mortality. Homicide's rank (12) stayed the same between 1984 and 1985.

Between 1984 and 1985 only two causes of death showed decreases in age-adjusted rates -- chronic liver disease and cirrhosis (-11.5%) and cerebrovascular disease (-1.9%). The largest percent increase occurred for motor vehicle accidents (15.2%). Among diseases, the rate for pneumonia and influenza increased almost ten percent. Small increases (less than one percent) occurred for diseases of heart and malignant neoplasms.

Among malignant neoplasms, decreases occurred for malignant neoplasms of the digestive organs, breast, and genital organs; increases occurred for malignant neoplasms of the respiratory system and urinary organs. Rates for leukemia stayed the same between 1984 and 1985.

Age-Adjusted* Death Rates** for Selected Types of Malignant Neoplasms, Maryland, 1970, 1981, 1984 and 1985

Cause of Death	<u>1970</u>	1981	1984	1985
Total Malignant Neoplasms	148.0	151.3	149.2	150.6
Malignant Neoplasms of Digestive Organs and Peritoneum	39.0	37.7	36.8	34.7

^{**}Per 1,000 Population.

Infant Mortality

After declining to a record low of 11.7 deaths per 1,000 live births in 1983 and 1984, the infant mortality rate rose to 11.9 in 1985. The rate for white infants fell from 9.8 to 9.0, while the rate for all other races increased to 17.8 from the historic low of 15.7. Neonatal mortality decreased for whites and increased for infants of all other races. Postneonatal mortality rates rose only for infants of all other races.

Maternal Deaths

There were three maternal deaths to residents during 1985 -- the same number as in 1984. In 1983, five deaths were due to complications of pregnancy, childbirth and the puerperium.

MARRIAGES

There were 46,063 marriages performed in the State of Maryland in 1985, a 2.4 percent decrease from the total of 47,193 marriages occurring in the State in 1984.

Resident Status

Marriages in which one or both partners were residents of the State represented slightly more than 81 percent of the total number performed in Maryland. The remaining 19 percent involved couples who were both non-residents of Maryland. Cecil County ranked first with 29 percent of all non-resident marriages. Montgomery County ranked second with 14.3 percent, followed by Prince George's (9.2%), Washington (7.9%), and Garrett (6.9%) Counties.

Civil and Religious Ceremonies

In 1985, 37.2 percent of all marriages performed in Maryland were civil (non-religious ceremonies). For the entire State, more civil ceremonies occurred in Montgomery County than in any other political subdivision. The 2,552 civil ceremonies performed in this county accounted for 14.9 percent of all such ceremonies in the State. When the number of civil vs. religious ceremonies within a particular subdivision was examined, Cecil County ranked the highest and Dorchester County the lowest. The 2,056 civil ceremonies performed in Cecil County comprised 63.0 percent of all the marriages in that county, while the 50 performed in Dorchester County only represented 19.7 percent there.

Marriages by Previous Martial Status and Age

In 1985, 54.4 percent of all marriages were first-time marriages for both the bride and groom. On an individual basis, 66.8 percent of the brides and 65.3 percent of the grooms were marrying for the first time.

For those marrying for the first time, 17.6 percent of the brides and 6.9 percent of the grooms were less than 20 years of age. For those remarrying, 7.4 percent of the brides and 12.9 percent of the grooms were 55 years of age or older.

DIVORCES

The total number of divorces and annulments granted in the State was 16,187. This represented an increase of less than one percent from the 16,134 recorded in 1984.

Legal Grounds

The leading grounds for all divorces and annulments was voluntary separation. Voluntary separation accounted for 63.3 percent of all divorces and annulments while three years separation accounted for 21.1 percent.

Children Affected by Divorce

The number of children under 18 years of age involved in divorce numbered more than 12,135 in 1985. This represented a decrease of 4.7 percent. The average number of children per divorce was .75. Almost 50 percent of the divorces for which information on children was available reported no children. In addition, 27.7 percent had one child under 18 years of age, while 17.3 percent reported two or more children.

Duration of Marriage

Of the total number of divorces granted in 1985, 2.4 percent of divorced couples had been married less than two years, and 8.7 percent 25 years or more. Fifty-two percent had been married less than 10 years. The median duration of marriage was 8 years, indicating that 50 percent of those granted a divorce had been married less than eight years.

DEFINITIONS AND EXPLANATORY NOTES

The data contained in this report are presented on a <u>residence</u> basis, regardless of where the vital event occurred, unless specifically noted otherwise. Information on marriages and divorces is limited only to events occurring in Maryland.

I. DEFINITIONS

The definitions of some of the more frequently used terms in this report are as follows:

- A. <u>Live Birth*</u>: The complete expulsion or extraction from its mother of a product of human conception, irrespective of the period of gestation, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscle, whether or not the umbilical cord has been cut or the placenta is attached.
- B. Fetal Death*: Death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.
- C. Infant Death: Death occurring to a person under age one.
- D. Neonatal Death: Death occurring to a person under 28 days of age.
- E. <u>Perinatal Death</u>: Death occurring after 20 weeks of gestation but before 28 days after birth. The perinatal deaths included in this report are, therefore, the sum of the reportable fetal deaths (fetal deaths after 20 weeks gestation) and the neonatal deaths.
- F. Low-weight Birth: A live birth weighing under 2,500 grams (5 1/2 pounds).
- G. <u>Length of Pregnancy</u>: A measure of the duration of gestation in completed weeks, as calculated from the first day of the last normal menstrual period to the date of birth.
- H. Birth Rate: Number of live births per 1,000 population.
- I. <u>Death Rate:</u> Number of deaths from all causes per 1,000 population. Death rates for specific causes are per 100,000 population.
- J. Infant Mortality Rate: Number of infant deaths per 1,000 live births.
- K. <u>Fetal Mortality Rate</u>: Number of reportable fetal deaths per 1,000 <u>total</u> births. Total births include live births plus fetal deaths of twenty weeks gestation or more.
- L. <u>Neonatal Mortality Rate</u>: Number of neonatal deaths per 1,000 live births.

- M. <u>Perinatal Mortality Rate</u>: Number of perinatal deaths per 1,000 <u>total</u> births. Total births include live births plus fetal deaths of twenty weeks gestation or more.
- N. Age-adjusted Death Rate: The age-adjusted rates were computed by the direct method. The age-specific death rates for a given cause of death were applied to the standard U.S. population of 1940. The rates were based on 5 year age groups. Age-adjusted rates should not be compared directly with crude death rates.
- O. Maternal Mortality Rate: Number of maternal deaths per 100,000 live births.

*The definitions of terms A and B are set by law in Section 14 (a) of Article 43 of the Maryland Code, 1957 Edition - Supplement. However, fetal deaths are reportable for filing purposes only if the death occurs after a gestation period of twenty completed weeks or more (Section 21 (a) of Article 43 supra). Therefore, the fetal deaths included in this report cover only those of twenty or more weeks of gestation.

2. EXPLANATORY NOTE ON POPULATION ESTIMATION

The population estimates used in this report for the entire State of Maryland and the political subdivisions for July I, 1985 correspond with those which will be published by the U.S. Bureau of the Census in <u>Current Population Reports</u>, Series p-26, No. 85-MD-C.

The subdivision estimates for July 1, 1985 in this report were prepared jointly by the Center for Health Statistics, Maryland State Department of Health and Mental Hygiene and the U.S. Bureau of the Census. The subdivision estimates are computed as an average of the following three methods:

The Regression (Ratio-correlation) Method. In the Regression Method, a multiple regression equation is used to relate changes in a number of different data series to change in population distribution. The series of data used in the Regression Method for Maryland are: two-year average of resident births (X₁), elementary school enrollment in grades I through 8 plus elementary special and elementary ungraded enrollment (X₂), automobile registrations (X₃), and individual State income tax returns (X₄). The equation for the 1980's is given by

$$Y = 0.124 + 0.155X_1 + 0.227X_2 + 0.179X_3 + 0.324X_4$$

2. The Administrative Records Method. This is a component method that uses Federal tax data to measure the net intercounty migration of the nongroup quarters population under 65 years old, reported resident birth and death statistics to estimate net natural change, and data on Medicare enrollees to estimate the population 65 years old and over. Tax data are used in the base year and the estimate year to determine the number of persons whose county of residence changed during the period. A net migration rate based on exemptions claimed by the matched cases is applied to the nongroup quarters population under 65 years old. These estimates of migration are then combined with the independent estimates of the population 65 years old and over, inmates of

institutions, college students in dormitories, military personnel living in barracks, and the other components of population change (births, deaths, immigration from abroad, and net movement between the military and civilian population) to yield an overall estimate of the total population.

3. State Income Tax Return Method. In the State Income Tax Return Method, the sum of persons filing individual Maryland resident income tax returns plus their spouses are used to estimate the total population 18 years through 64 years of age. These estimates, for each subdivision, are then combined with independent estimates of the populations under 18 years and over 64 years of age, computed as follows, to yield estimates of the total population.

Within the State Income Tax Return Method, the population 5-17 years of age is estimated on the basis of migration rates calculated from school enrollment data (by age, race, and grade) supplied by the Maryland State Department of Education and applied to the "expected" population 5-17 years of age on July I, of the estimate year. The "expected" population consists of 1980 census survivors from the date of the census to the estimate date. Race breakdowns are based on changes in public school enrollment of all other races as a proportion of all enrollment since the 1980 census.

The population under 5 years of age is estimated by race on the basis of adjusted net migration rates for the school age population applied to the "expected" population under 5 years of age on July I, 1985. The "expected" population consists of 1980 census survivors and survivors of births occurring between the date of the census and the estimate date (including corrections for "migration exposure").

The population 65 years of age and over is estimated on the basis of data on Medicare enrollments by race and sex supplied by the Social Security Administration, U.S. Department of Health, Education and Welfare. The changes in the Medicare enrollments for each age-race-sex group for the estimate year are applied to the population estimates of the previous year.

In addition to the above estimates, the Center for Health Statistics estimates the population 18-64 years of age in detailed age groups by race and sex as follows:

Age and race-specific driver license statistics for males obtained from the Maryland Department of Motor Vehicles are used to estimate the male population aged 18 to 64 years in several stages: 18 to 19, 20 to 24, etc. Sex ratios, based on the 1980 census, are used to estimate the female population. These estimates of the 18-64 population are then adjusted so that the sum of all age groups in each subdivision equals the population estimate for the subdivision. Various adjustments for changes among "special" groups of persons, i.e., those in institutions, in the armed forces, or spouses of members of the armed forces, are utilized in estimating the various age groups before adjustments are made to the final subdivision estimate.
